Feature on weed management and fire

There has been great interest in the bushfire-weed information sources we have been sharing. This supplement to our summer update is focussed on sharing more of those information sources to help biodiversity managers impacted by fire focus on making a smooth recovery.

Figure 1: Burning of Phalaris (Phalaris aquatica) for promotion of native grassland species, Victoria Mine, Beaufort.

Fire and weeds

Whether it’s a bushfire, grassfire, fuel reduction activity or ecological burn (Figure 1), fire provides an opportunity to interrupt the life cycle of many environmental weeds.

There is a brief window of opportunity after fire to have a big impact on many weeds including some early invaders.

Influence of fire on weeds, and weeds on fire

Weeds can play a role in bushfire situations including:

- Can increase the fuel load (Figure 2) and make for a more intense and severe fire, causing not only a higher threat to life and property but also slower recovery for indigenous species.

- Weeds may be fire-responsive, meaning that they come back with a vengeance post-fire, e.g., mass germination of hard-coated seeds.

- Weeds can maintain establishment in unburnt patches within the fire area where they can set seed and spread into the burnt areas.

- Can be inadvertently spread by firefighting vehicles, machinery and clothing of personnel if good hygiene practices aren’t in place.

- Heavy rain after fires can lead to flash flooding and wash of weed seeds down slopes and watercourses.

Benefits of fire for weed management

- It provides an opportunity to tackle emerging weed seedlings post-fire (when it is safe to enter the burnt area) to prevent them reaching maturity and setting seed.

- Provides access to mature plants that remain in unburnt patches. These can be treated prior to seeding in the burnt area to prevent them from spreading there or causing reinvansion.

- Some species aren’t tolerant of fire and a fire will wipe them out!

Figure 2: Buffel Grass (Cenchrus ciliaris) adds to the intensity of a fire in Spinifex country in Aliyntjara Wilurara NRM Region, SA.

Early Invader Update

Tools to help

Immediately after an unexpected fire, it can be hard to know where to start especially when juggling recovery of infrastructure, wildlife, and looking after people and impacted communities. Pre-planning contingencies has benefits.

The following documents are some of the tools available that can help. It is not an exhaustive list and many agencies including interstate and overseas are always adding new material that can be relevant here.

You might like to start with the decision-making framework (Figure 3 and enlarged in the “Early invader manual”) to guide you through the process of dealing with these threats.

### Tarnook, FireWeb and EM-COP

- **Post-fire invasive plants triage**
  - Steve Taylor (Project Ranger-in-charge) & Harley Baker (Project Ranger)
  - ACT Parks & Conservation Service – Invasive Plants Program
  - Environment, Planning & Sustainable Development

**Introduction**

There are two parts to post-fire invasive plants triage:

1. Severe disturbance assessment mapping (developed by ACT Parks)
2. Post-fire weeds triage decision key (developed by Parks Victoria, Zimmer et al 2012)

- Severe disturbance mapping to help locate areas at risk of environmental weed invasion.

ACT are doing great work integrating triage with mobile weed mapping and linking to iNaturalist projects (see below).

Steve Taylor @steve.taylor.818 has a great Facebook feed including many invasive species posts.

### Social Media Platforms

Social media platforms including: Twitter, Facebook, Instagram, DELWP Yammer

- Many researchers, fire management agencies and field practitioners are active.
- Aliens-L listserver can draw in people from overseas who may have weed/fire information to share.
- Facebook groups (some private) include: FFMVic firefighters; Bush Revegetation and Regeneration; Early Invader Weeds Victoria; The Weed Society of Victoria Inc.

### General Fire Recovery

- Bushfire Recovery Victoria
- Agriculture Victoria
- VicEmergency relief and recovery
- Landcare after the fires
- Landcare after the fires - weeds
- SWIFFT fires & biodiversity
- Bushfire recovery SA
- Managing weed spread after fire

There is an increasing amount of information available online. Here are just a few examples. Check interstate, local government areas, utility managers and natural resource management agencies too.
Preventing weed spread during fire activities

DELWP North Altona has washdown trailers (Figure 4) available for cleaning vehicles and equipment near the fire line or at base camp. They can be used anywhere in the State. Contact Altona North for details and other vehicle and equipment washdown options.

Figure 4: Mobile washdown trailer available from DELWP Altona for deployment anywhere in Victoria.
Credit: Kate Blood, DELWP (2015).

When conducting your post-fire weed activities be sure the area is safe to enter, before commencing surveys and treatment. Check equipment and clothing to prevent carrying weed seeds and soil-borne pathogens into new areas.

Another note is to be cautious when feeding wildlife in burnt areas. Depositing hay or fodder contaminated with invasive plants can introduce new weed species to a landscape. Selecting ‘cleaner’ hay or fodder is a better option if available. Concentrating wildlife around feed stations can prove counterproductive as it is also a place where predators can congregate.

Some words of wisdom from NSW

Dr Keith McDougall shared some words of wisdom with us in late January 2020. Keith has many skills and interests including alpine, fire and invasive species ecology — a perfect combination for managing weeds in the Australian alps.

A paper that Keith and Dr Neville Walsh prepared after the 2003 fires mentions “an increase in weed richness after the fire but also includes glimmers of hope about native species that can appear after fire (and the increase in weed richness was mostly short-lived; except for ox-eye daisy). We commonly found species that had been rare before the fire and one species that hadn’t been seen in the Alps before; all have since largely disappeared”.

Ox-eye Daisy (Leucanthemum vulgare) is an invasive perennial forb from Europe and West Asia (Figure 5). It forms a persistent seed bank and has underground stems (rhizomes). It spreads easily, invades undisturbed areas and is difficult to kill.

Once a fire has passed through an infested area, it has a competitive advantage over the indigenous vegetation and quickly occupies bare-ground post-fire.

The Australian Seedbank Partnership, Keith says, “talks about some of the other native species discoveries made at the time. I still live in hope of finding Irene pharsus magicus [Illawarra Irene] in NSW - perhaps after the current fire. So, good to be out there looking for new weeds and weeds that take advantage of the fire, but it can be a great opportunity to make new discoveries of native species while doing that”.

Figure 5: Ox-eye Daisy (Leucanthemum vulgare) in Kosciuszko National Park NSW. Site in photo was burnt in 2007, but otherwise undisturbed.
Credit: Elouise Peach (via Keith McDougall), Office of Environment and Heritage, NSW.

Keith’s other message is “to be safe. It may be another month before I can get into my field sites. The fires were so fierce that many trees up here have become unstable – branches and trunks keep falling near where I live.”

In the last issue of the “Early Invader Update” (#17, January 2020), we shared a quote from an article by Keith McDougall about Ox-eye Daisy in Kosciuszko National Park. We think it captures the WESI approach nicely:

“Our greatest regret is not commencing control until Ox-eye Daisy was a problem. If the species had been treated when it was known only from small patches close to Nungar Creek in the 1990s, it would not have expanded to its current extent. The clear message from
this is: remove non-native plant species when they are rare because, although most might never amount to much, some will and the consequences and cost of management are then huge”.

...And from Victoria:

Parks Victoria’s Keith Primrose: “Yes, ox-eye is a major concern for us, among others. We are currently involved in a variety of response/recovery planning processes to work out what to do and how to resource it. It’s really challenging as the situation is complex and still evolving.”

Ox-eye Daisy is only one of many invasive species spreading in areas impacted by fires.

Finally

The WESI team would like to acknowledge the bushfires still burning in Australia, the communities impacted, and the tireless efforts of firefighters. Thanks to everyone who contributed to this issue and who are willing to share experiences and knowledge with others.

Please share with us any other great bushfire-weed references, social media feeds or links so we can pass them through our networks.

Fell free to share this update through your networks.

Til next time!
